

## Code Review

### 1. Discord tag

**Current Code Snippet:**

```
<li></li>
```

**Current Outcome:** The code currently only displays my Discord tag as a tooltip.

**Desired Outcome:** The desired outcome would display a “Copy Discord tag” tooltip and copy the tag to the clipboard when the image is clicked.

**New Code Snippet:**

```
<li></li>
```

```
function copyDiscordTag(){
  console.log("clicked");
  const DISCORD_TAG = "Goofyeet#2005";

  let textArea = document.createElement('textarea');
  textArea.style.display = "none";
  textArea.value = DISCORD_TAG;
  document.body.appendChild(textArea);

  navigator.clipboard.writeText(textArea.value);
}

let discord = document.getElementById("discord");
discord.addEventListener("click", copyDiscordTag);
```

**New Outcome:** The new Javascript code creates an event listener for when the Discord image gets clicked. When the event fires, the “copyDiscordTag” event handler is called which creates a hidden textarea and sets its value to my Discord tag. Then this text gets copied to the clipboard using the clipboard web api.

## 2. Empty Github Search

### Code Snippet:

```
<form action="https://github.com/search" method="GET" target="_blank"
id="search">
    <label>Explore Github</label>
    <div>
        <textarea name="q" placeholder="Explore Github"
id="searchBox"></textarea>
        <input type="submit" value="Search">
    </div>
</form>
```

**Current Outcome:** The search box allows the user to search Github without entering anything.

**Desired Outcome:** I can validate that the search is not empty by using Javascript.

### New Code Snippet:

```
else if (htmlDoc == "projects.html") {
    let textArea = document.getElementById("searchBox");
    let search = document.getElementById("search");

    search.addEventListener("click", function (event) {
        if (textArea.value == "") {
            event.preventDefault();
        }
    })

    textArea.addEventListener("input", function (event) {
        let value = event.target.value;
        let newColor = ["red", "black"];
        let pick = value.length % newColor.length;

        textArea.style.color = newColor[pick];
    })
}
```

**New Outcome:** This new code, checks if the textarea value is an empty string, if it is the default action is prevented with the `event.preventDefault()` method which prevents the search query from being sent to Github.
